Parts of the Human Brain Definition Labels

Brain Stem

The stalk-like part connecting the brain to the spinal cord; controls automatic functions like breathing and heart rate.

Cerebellum

The part of the brain at the back that controls balance and coordination.

Cerebrum

The largest part of the brain; controls thinking, learning, and voluntary movement.

Corpus Callosum

The bundle of nerve fibers that connects the brain's left and right halves.

Frontal Lobe

The front part of the cerebrum that controls thinking, decision-making, and movement.

Hypothalamus

A small structure that helps control body temperature and hunger.

Occipital Lobe

The back part of the cerebrum that processes what we see.

Parietal Lobe

The part of the cerebrum that handles touch and spatial awareness.

Pituitary Gland

A pea-sized gland that releases hormones to control growth and other body functions.

Pons

Part of the brain stem that relays messages between the brain and the rest of the body.

Spinal Cord

The long bundle of nerves that connects the brain to the rest of the body.

Temporal Lobe

The part of the cerebrum that processes hearing and memory.

Thalamus

A structure that relays sensory information to the right part of the brain.

Ventricle

A fluid-filled space inside the brain that produces and circulates cerebrospinal fluid.
